

Coming back to the use of typefaces in electronic publishing: many of the new typographers receive their knowledge and information about the rules of typography from books, from computer magazines or the instruction manuals which they get with the purchase of a PC or software. There is not so much basic instruction, as of now, as there was in the old days, showing the differences between good and bad typographic design. Many people are just fascinated by their PC's tricks, and think that a widely-praised program, called up on the screen, will make everything automatic from now on. Yeah, my mother is not expendable. And your mother is not expendable. And our brothers and sisters are not expendable. And we're not going to accept a premise that human life is disposable. And we're not going to put a dollar figure on human life. First order of business is: save lives. Period. Whatever it costs. Now, I also don't believe it's an either or. I believe you can have an intelligent refined public health strategy. You talk about risk stratification. You can have people go to work. You can test people and find out that they are

resolved from the virus. Let them go back to work. You can let go younger people back to work. You can have an economic startup strategy that is consistent with a public health strategy. It's smart. It's complicated. It's sophisticated. But that's what government is supposed to do, right. That whole concept of developed government policy and program. You can do both. But not in a clumsy ham-handed way. Right? "Well, we'll just sacrifice old people, they're old people anyway, and the old get left behind." What is this? Some modern Darwinian theory of natural selection? You can't keep up so the band is going to leave you behind. We're gonna move on and if you can't keep up you, well then you just fall by the wayside of life. God forbid. Coming back to the use of typefaces in electronic publishing: many of the new typographers receive their knowledge and information about the rules of typography from books, from computer magazines or the instruction manuals which they get with the purchase of a PC or software. Coming back to the use of typefaces in electronic publishing: many of the new typographers receive their knowledge and information about the rules of typography from books, from computer magazines or the instruction manuals which they get with the purchase of a PC or software. There is not so much basic instruction, as of now, as there was in the old days, showing the differences between good and bad typographic design. Many people are just fascinated by their PC's tricks, and think that a widely-praised program, called up on the screen, will make everything automatic from now on. Yeah, my mother is not expendable. And your mother is not expendable. And our brothers and sisters are not expendable. And we're not going to accept a premise that human life is disposable. And we're not going to put a dollar figure on human life. First order of business is: save lives. Period. Whatever it costs. Now, I also don't believe it's an either or. I believe you can have an intelligent refined public health strategy. You talk about risk stratification. You can have people go to work. You can test people and find out that they are

resolved from the virus. Let them go back to work. You can let go younger people back to work. You can have an economic startup strategy that is consistent with a public health strategy. It's smart. It's complicated. It's sophisticated. But that's what government is supposed to do, right. That whole concept of developed government policy and program. You can do both. But not in a clumsy ham-handed way. Right? "Well, we'll just sacrifice old people, they're old people anyway, and the old get left behind." What is this? Some modern Darwinian theory of natural selection? You can't keep up so the band is going to leave you behind. We're gonna move on and if you can't keep up you, well then you just fall by the wayside of life. God forbid.
